Data Quality Scorecard

Dataset: student_sleep_screen_time_academic_performance.csv | 500 rows × 25 columns

Snapshot: 12,500 cells; 51 missing (99.59% complete); 0 duplicate rows; 500/500 unique student IDs.

DAMA six-dimension assessment

Dimension	Evidence / score	Assessment
Completeness	99.59%	Strong overall; investigate 51 missing cells.
Uniqueness	100% IDs unique	Pass for student IDs; no duplicate full rows.
Consistency	Needs improvement	Gender uses mixed case and abbreviations.
Validity	Partial / rules needed	Add range and category expectations; confirm business bounds.
Accuracy	Not scored	Requires trusted source/reference for comparison.
Timeliness	Not scored	No reliable collection timestamp/freshness rule identified.

Priority improvement recommendations

• **1. Resolve missingness:** investigate the five affected columns; distinguish unknown/not applicable from accidental blanks; impute only with documented rationale.

• **2. Standardize categories:** map M/male → Male and F/female → Female; validate against an approved category list.

• **3. Automate checks:** run expectations before each dashboard refresh; quarantine failed batches and retain validation results.

• **4. Improve timeliness:** add collection/refresh timestamps and define a freshness SLA.

• **5. Protect privacy:** omit student_id from dashboard aggregates; tokenize only when row-level linkage is necessary and restrict the mapping.

Privacy: student_id is pseudonymous; age, gender, major, and behavioral/academic measures may identify people in combination. Aggregate outputs and suppress small groups.

Note: Accuracy and timeliness are not given invented numeric scores. The HTML contains executed pandas checks because GX was unavailable in this environment.
